

Second ResearchMind Evaluation Paper

Abstract

This paper focuses on multi-document analysis for AI research assistants. It examines how comparing uploaded papers can help researchers identify shared methods, differences in findings, and gaps for future work.

Methodology

The system stores multiple papers per user, retrieves relevant chunks from each document, and asks a Gemini model to produce a comparison table and narrative synthesis.

Findings

Multi-paper comparison is useful when papers discuss related systems but differ in datasets, methods, limitations, or evaluation criteria.

Limitations

Comparison quality depends on having enough well-extracted source text from each uploaded paper and accurate retrieval across the vector index.
